

Developing the mind means unlocking potential and independence

NeuroDevelopmental Programming does not make robots.

The programming increases neural pathways through actions physical and mental which have been proven to work to create and develop neural pathways.

Neural pathways control cognitive ability. Neural pathways affect memory access. Neural pathways are the door for imagination to be unlocked. Neural pathways are what make speech possible.

These things are all part of the decision making process that all people use everyday.

Limiting the number of neural pathways that are healthy and functioning properly creates limits.

The first limit is decision making which is an essential component of being able to live an independent life. Without the ability to weigh pros and cons properly, they can not take care of themselves. The next limit is normally speech which means that communication is not that good. Communication is essential to living independent in society. Memory is probably next which explains why so many get confused easily, and it also explains why routine is inordinately important.

NeuroDevelopmental Programming helps the person have the neural pathways that they need to function the same as everyone else in society.

As good as it is, it is just a starting point to better things. It creates the bar that says that independence is a possibility, and it is from this point that new directions can be explored.
